

Mini data sheet on *Cameraria ohridella*

Added in 1996 - Deleted in 2001

Reasons for deletion:

During the PRA (00-8414) it was concluded that due to rapid and natural spread of *Cameraria ohridella*, no practical phytosanitary measures could be taken. In 2001, the pest was therefore removed from the EPPO Alert List.

***Cameraria ohridella* (Lepidoptera: Lithocolletidae) - horse chestnut leafminer**

Why	<i>C. ohridella</i> came to our attention because of its current spread in European countries.
Where	First described as a new species in the Republic of Macedonia in 1985, it then spread to many other European countries. Albania, Austria (1989), Belgium (2000), Bosnia & Herzegovina, Bulgaria, Croatia (1995), Czechia (south Moravia, 1993; Bohemia, 1994), France (2000), Italy (north, 1992), Germany (south, 1994; Nordrhein, 1998), Hungary (1994), Netherlands (1999), Poland (1998), Romania, Slovenia (1995), Slovakia (1996), Switzerland (1999), Yugoslavia.
On which plants	horse chestnut (<i>Aesculus hippocastanum</i>)
Damage	Mines in the leaves. Heavy infestations lead to brown discoloration and death of the leaves, and finally defoliation of the tree.
Note	Passive spread on vehicles is reported to be the most efficient mode of dissemination of the pest over long distances.
Pathway	Plants for planting (cut branches?) of <i>A. hippocastanum</i> .
Possible risks	Horse chestnut is an important amenity tree throughout Europe. <i>Cameraria ohridella</i> has obviously a great potential for spread but the insect does not usually cause tree mortality. Possibilities for control appear limited.
