

Corrigendum

Following a comment from Greece during country consultation, the EPPO Panel on Diagnostics and Quality Assurance reconsidered the size of the filter to be used for molecular grade water (MGW) if the MGW is sterilized by filtration (which is given as an option in many EPPO Diagnostic Standards). It was agreed that the existing size 0.45 µm was not adequate and that 0.22 µm filters should be used.

All the EPPO Diagnostics Standards (only the most recent version was considered for those Standards which have been revised) were reviewed for mention of 0.45 µm filters.

In the following protocols, the size of the filters for sterilization of MGW should be reduced from 0.45 µm to 0.22 µm:

- EPPO (2017) PM 7/2 (2) *Tobacco ringspot virus*.
 - EPPO (2014) PM 7/14 (2) *Ceratocystis platani*.

- Three other EPPO Standards also mention 0.45 µm filter size for preparation of other sterile components (CCT media, sterile leachate and sterile water for both N-lauroylsarcosine and SDS, respectively). For the latter, a range had been given (0.2–0.45 µm). The filter/membrane size for preparation of sterile components should also be reduced to 0.22 µm in these Standards:
- EPPO (2013) PM 7/20 (2)² *Erwinia amylovora*.
